

Instructions

- 1) Please use the code that you wrote yesterday and add @PutMapping to it and try changing a value.
- 2) Then add a client-server design to it where you call the service from another service (perhaps use Feign).
- 3) Then create a service registry (Eureka) and see if you can decouple the client and server by going through the service registry. Another technology that is very common in the market for Service Discovery is HashiCorp Consul.
- 4) Then see if you can apply the circuit-breaker this whole stack.

Again, you can refer to examples for help.
